

How are you handling Cybersecurity risks?

The NIST Cybersecurity Framework provides a basic and understandable language of five key Functions-Identify, Protect, Detect, Respond, Recover - for managing risk iteratively over time.

Develop organizational understanding to manage cybersecurity risk to systems, assets, data, and capabilities.

Develop and implement the appropriate safeguards to ensure delivery of services.

Develop and implement the appropriate activities to identify the occurrence of a cybersecurity event.

Develop and implement the appropriate activities to take action regarding a detected cybersecurity event.

Develop and implement the appropriate activities to maintain plans for resilience and to restore any capabilities or services that were impaired due to a cybersecurity event.
